## DBMS END TERM EXAM.

Chanakwii Shivathmika 19BCS029

The company XYZ intends to store it's employee data in a heap fike with a dustered index on the emphanne field. It is to be noted that a heap is a table with no clustered indices. Data is stored without specifying any order to store the now efficiently.

Thus, it is not possible to store data in a heap file with a clustered index in a field. Alternatively, it is completely possible to store the data with an index on empidifield because it eventually becomes a primary index and thus, non-clustered indices are allowed in heap files. Biles.

- (i) DDL is important in Representing information in DBMS because it is used to describe External and logical Schemes.
- (ii) DML is used to <u>modify</u> and <u>manipulate</u> data; it is not important for <u>Representing the data</u>.

## 3) TRUE

## Justification:

A DBMS is typically shared among users. Transactions from these users can be interleaved to improve the execution time of user's queries.

By interleaving queries, users donot have to wait for other users transactions to complete before their own transaction begins

Without interleaving, if user A begins a transaction that will take 10 seconds to complete, and user B would have to writ an additional 10 seconds for user A's transaction to complete before the database would begin processing user B's request-

4)

a) A user must quarantee that his or her transaction does not corrupt data or insert nonsense in the database.

for example, in a banking database, a user must queviantee that a cash withdraw transaction accurately models the amount a person removes from his or her account. A database application would be worthless if a person removed Rs. 15001- from our ATM but the transaction get their balance to zero.

b) A DBMS must quarantee that transactions or executed fully and independently of other transactions. An essential property of a DBMS is that a transaction should execute automatically, or as if it is the only transaction running. Also, transactions will either complete fully, or will be abouted and the database returned to it's initial state. This ensures that the database remains consistent.

Since we can determine the key of relation with the help of instance e.g. In a one to many relation we can consider the column or attribute with unique values as a primary key.

6)
a) Create clustered index IX\_emphane\_index ON
ON
STUDENT TABLE (studentName DESC)

"Select Email from STUDENTTABLE

This query displays all the Emails in the descending order of the Student Name. First the table gets sorted based on student name in DESC order and then the select query displays the emails in that order.

| b) | Student ID | Student N | ame Email       | Age. |
|----|------------|-----------|-----------------|------|
|    | 1005       | Krishna   | Krishna@pg1.com | n 22 |
|    | 1030       | John      | Null            | 23   |
|    | 1020       | John      | Th@xyz.con      | 1 22 |

7) 
$$\rho(R_1, Calalog)$$
  
 $\rho(R_2, Calalog)$ 

$$TT_{R_1,pid} \circ T_{R_1,pid} = R_2 \cdot pid \wedge R_1 \cdot sid! ! = R_2 \cdot sid (R_1 \times R_2)$$
using:

| SID | PID | Cost (Rs.) |
|-----|-----|------------|
| 1   | 1   | 600        |
| _ 2 | 1   | 550        |
| 2   | 3   | 2000       |
| 3   | 1   | 650        |

| SID | PID   | Cost (Rs) | SID | PID   | Cost (Rs) |

|     |       | 1         |     | 1     |           |

## Chamakuri Shivathmika

ORI. pid = R2. pid gives!

| SID   | PID      | Cost (Rs) | SID | PID | Cost (Rs). |
|-------|----------|-----------|-----|-----|------------|
| 1     | 1        | 600       | 1   |     | 600        |
| 10.11 |          | 600       | 2   | 6)  | 550        |
| 1     | 1        | 600       | 3   | 1   | 650        |
| 2     | 1        | 550       | 1   | )   | 600        |
| 2.    | <b>\</b> | 550       | 1 2 | 1   | 550        |
| 2.    | . 1      | 550       | 3   | k   | 650        |
| 2     | 3        | 2000      | 2   | 3   | 2000       |
| 3     | 1        | 650       | - 1 | 1   | 600        |
| 3     | 1        | 650       | . 2 | ·   | 550        |
| 3     | 1        | 650       | 3   | 1   | 650        |
|       |          | -         |     |     | ,          |

OR, pid = R2. pid 1 R1. sid ! = R2. sid gives.

| SID                                     | PID | coct (R<) | SID | PID " | Cost(Rs) |
|---|-----|-----------|-----|-------|----------|
|   | 1   | 600       | 2 . | *     | 550      |
| ( · · · · · · · · · · · · · · · · · · · | 1   | 600       | 3   | 1     | 650      |
| 2                                       | -   | 550       | 1   | 1     | 600      |
| 2                                       | 1   | 550       | 3   | ) '   | 650      |
| 3                                       | 1   | 650       | 1   | 1     | 600      |
| 3                                       | 1   | 650       | 2   | 1     | 550      |

SQL Query:

SELECT . C. sid

FROM Catalog C

WHERE EXISTS (SELECT CI.Sid FROM Catalog CI WHERE CI.pid = C.pid AND CI.Sid 6 = C.Sid) 8) Invalid query

Explanation:

This relational algebra statement doesnot return anything because of the sequence of projected, projection operators. Once the sid is projected, it is the only field in the set therefore, projecting on same will not return anything.

The following view on Emp can be updated automatically by updating Emp:

CREATE VIEW SeniorEmp (eid, name, age, calary)

AS SELECT E.eid, E. name, E.age, E. salary

FROM Emp E

WHERE E.age > 50
